Note: Within nine months from the publication of the mention of the grant of the European patent, any person may give notice to the European Patent Office of opposition to the European patent granted. Notice of opposition shall be filed in a written reasoned statement. It shall not be deemed to have been filed until the opposition fee has been paid (Art. 99(1) European patent convention).

EP 0 303 520 B1

## Descripti n

The present invention relates to a bleach composition and a bleaching detergent composition.

Chlorinated bleaching agents have disadvantages in that they are limited in the kind of fibers to which they are applicable, they cannot be applied to colored or patterned cloth and they have a distinct odor. Recently, therefore, oxygen-containing bleaching agents free from these disadvantages have been widely used.

In particular, sodium percarbonate and sodium perborate have become widely used as such oxygen-containing bleaching agents owing to their excellent bleaching performance and stability.

As oxygen-containing bleaching agents exhibit a poorer bleaching power than chlorinated bleaching agents, various bleach activators are used in conjunction with these. Studies have been made on various such activators and examples include nitriles such as acetonitrile, malononitrile, phthalonitrile and benzoyliminodiacetonitrile; O-acetates such as glucose pentaacetate, octaacetylsucrose, triacetin, sorbitol hexaacetate, acetoxymethanesulfonates, triacetyl cyanurate and methyl chloroformate; N-acylates such as N,N,N',N'-tetraacetylenethylenediamine, tetraacetylglycoluril, N-benzylimidazole, di-N-acetyldimethylglyoxime, 1-phenyl-3-acetylhydantoin, N,N-diacetylaniline, N-acetyldiglycolimide and diacetylmethylenediformamide; acid anhydrides such as phthalic anhydride, succinic anhydride, benzoic anhydride, glutaric anhydride, alkylsulfuric anhydride and mixed anhydrides of carboxylic acids and organic sulfonic acids; sulfonyl oximes such as di(methanesulfonyl)dimethylglyoxime; acyl phosphates such as diethyl benzoyl phosphate; phenylsulfonates; organophosphoric azide such as diphenylphosphinic azide; disulfones such as diphenyl disulfone; N-sulfonylimidazole, cyanamide, halogenated triazine and N, N-dimethyl-N-octyl-N-10-carbophenoxy-dodecylammonium chloride. However, the bleaching power of oxygen-containing bleaching agents has been found to be poor even when used together with any of the activators listed above.

Known compounds having

groups in the molecule include the following compounds:

(J.Org.Chem., 1977, Vol. 42, No.2, pp. 26 ~ 32),

(J.Chem.Soc.Perkin Trans., 2, 1978, No.8, pp. 786 ~ 793),

(U.S. Patent No. 3281452), and

(British Patent No. 1178371).

European Patent Publication 0186052 discloses hydrogen peroxide activation in bleaching compositions using a quaternary ammonium precursor having three alkyl or aryl groups and one ester-substituted alkyl or aryl group.

According to the present invention we provide a bleaching composition which comprises (a) a peroxide and (b) an organic peracid precursor of at least one of the following formulae:

in which R1 is an unsubstituted C1 to C24 alkenyl, an unsubstituted alkaryl having a C1 to C24 alkyl, R2 and R3 are each independently a C1 to C3 alkyl, hydroxyalkyl having 1 to 3 carbon atoms,  $-(\text{C}_2\text{H}_4\text{O})_n$  H, n being 1 to 6,  $-\text{CH}_2\text{CN}$  and X is an anion;

in which each of R1 to R5 is independently hydrogen, a C1 to C10 alkyl, a C1 to C10 alkenyl, a substituted C1 to C10 alkyl, a substituted C1 to C10 alkenyl, carboxyl, sulfonyl or cyano, X is an anion;

in which R1, R2, R3 and R4 are each independently a C1 to C6 alkyl, n is an integer from 1 to 16 and x is an anion; or

an alkylene diamine or a polyalkylenepolyamine compound having at least one quaternary ammonium group with either one or two  $-\text{CH}_2\text{CN}$  groups directly bound to the quaternary nitrogen.

It is preferred that the mole ratio of (a) to (b) ranges from 99.9/0.1 to 20/80 and the component (b) is contained in the composition in the form of granules of a blend of 100 parts by weight of (b) and 5 to 20 parts by weight of a binder.

Then the invention provides a cationic compound having the generic formula (b-6) defined above.

In the invention, the component (b) is required to have a cationic group  $-N-CH_2-C \equiv N$ . The group (b-2) has two groups of (b-1), however including one cationic nitrogen common to both groups.

The invention will now be further explained with reference to the preferred embodiments of the component (b).

component (b-3)

[ $R_1$  stands for a straight chain or branched unsubstituted  $C_1$  to  $C_{24}$  alkenyl group or an unsubstituted alkaryl group (the alkyl group thereof having 1 to 24 carbon atoms),  $R_2$  and  $R_3$  each stand for a  $C_1$  to  $C_3$  alkyl or hydroxyalkyl group,  $-(C_2H_4O)_1-5H$  or  $-CH_2CN$  and  $X$  is an anion.]

The above ammonium salts can be easily prepared by, for example, the reaction between a corresponding amine and an halogenated nitrile as represented by the following reaction formula:

compound (b-5)

wherein  $R_1 - 5$  each stand for a hydrogen atom, a straight-chain or branched  $C_1 - 10$  alkyl or alkenyl group which may be substituted or a carboxyl, sulfonyl or cyano group and  $X^-$  stands for an organic or inorganic anion.

The ammonium salt to be used in the present invention can be easily prepared by, for example, the reaction between a corresponding pyridine which is arbitrarily substituted with an alkyl, alkenyl, carboxyl, sulfonyl or cyano group and a halogenated nitrile as represented by the following reaction formula:

The pyridine to be used as a starting material, which is arbitrarily substituted with an alkyl, alkenyl, carboxyl, sulfonyl or cyano group, includes pyridine, 2-, 3- and 4- picolinic acids, nicotinic acid, 3,5-pyridinecarboxylic acid, 3-pyridinesulfonic acid, and 2-, 3- and 4-cyanopyridines, among which pyridine and nicotinic acid are most preferred owing to their high effect.

alkylenediamine compound and polyalkylenepolyamine compound

It has at least one quaternary ammonium group with either one or two  $-CH_2CN$  groups directly bound to the quaternary nitrogen.

The activator according to the present invention is derived from alkylenediamine or polyalkylenepolyamine. Particularly, alkylenediamines and polyalkylenepolyamines represented by the general formula:

(wherein  $R_1$  is a hydrogen atom or a lower alkyl group;  $R_2$  is a straight-chain or branched  $C_{2-10}$  alkylene group and  $n$  is 2 to 1,000) are useful as starting materials of the activators according to the present invention. A particular example of the alkylenediamine includes ethylenediamine, while examples of the polyalkylenepolyamine include relatively low-molecular weight polyethylenepolyamines having a molecular weight of up to 1000, such as diethylenetriamine, triethylenetetramine and tetraethylenepentamine, tripropylenetetramine, tetrabutylpentamine, dibutyltetramine, dihexylenetriamine and trihexylenetetramine.

The introduction of the group of

can be easily carried out by reacting the nitrogen atom of an alkylenediamine or polyalkylenepolyamine with a compound represented by the general formula:  $X-(CH_2)_n-C \equiv N$  ( $X$  is a halogen atom) to thereby form a quaternary ammonium compound, preferably chloroacetonitrile from the viewpoint of cost and availability.

Processes for preparing the activator of the present invention from ethylenediamine as a starting material will now be described.

These processes are only examples of the process for the preparation of the activator according to the present invention, so that the activator can be also prepared by processes other than those described above. The alkylenediamine or polyalkylenepolyamine to be used as a starting material may be either primary like those shown in the above examples or secondary or tertiary. The structure of the obtained activator varies depending upon the molar ratios of the chloroacetonitrile and alkyl halide used to the alkylenediamine or polyalkylenepolyamine as the starting material, so that various activators can be prepared.

In short, the activator according to the present invention corresponds to alkylenediamine or polyalkylenepolyamine wherein at least one, preferably at least two, nitrogen atom thereof is converted into a group of a structure represented by the formula:

compound (b-6)

This is most preferable component (b).

wherein  $\text{R}_1$ ,  $\text{R}_2$ ,  $\text{R}_3$  and  $\text{R}_4$  each stand for an alkyl group having 1 to 6 carbon atoms,  $\text{X}^{\ominus}$  stands for an organic or inorganic anion, and  $n$  is an integer of 1 to 16.

Of the novel compounds of the present invention, those of the formula (b-6) in which  $\text{R}_1$ ,  $\text{R}_2$ ,  $\text{R}_3$  and  $\text{R}_4$  each stand for an alkyl group having 1 to 3 carbon atoms, especially a methyl group, and  $n$  is an integer of 1 to 9 are especially valuable.

The compound of the general formula according to the present invention can be prepared, for example, according to the process described below. Namely, the compound of the formula can be easily prepared by reacting a tertiary alkylenediamine with a halide of acetonitrile as in the quaternization of an ordinary amine, as shown by the following reaction formula:

The compound (b-6) is novel and useful as a textile softener, an antistatic agent, a fungicide and a bleaching activator.

In the invention, the component (b) is easy to adhere on articles to bleach, owing to its cationic group. In addition, the carbon atom in the group  $-\text{CN}$  is easy to be positive electrically and active to the bleaching effect since the quaternary nitrogen is electron-attractive. This way the component (b) serves to provide for sites where bleaching takes place to the effect and enhance the bleaching power of the composition.

The activator according to the present invention can be granulated by an ordinary method prior to its addition to a peroxide. For example, 5 to 200 parts by weight, preferably 10 to 100 parts by weight, of one or more binders exhibiting a fluidity at 5 to 60°C, preferably 10 to 40°C, is added to 100 parts by weight of an activator and the obtained mixture is granulated.

The binder to be used may be one or more members selected from among nonionic surfactants polyethylene glycol, polypropylene glycol, liquid paraffins and higher alcohols which exhibit a fluidity at 5 to 60°C, preferably 10 to 40°C.

The granulation may be carried out by a method selected depending upon the kinds of the organic per acid precursor and binder used from among conventional methods such as extruding granulation, tumbling

granulation or compression granulation. For example, according to the extruding granulation, an organic per acid precursor which has been finely ground into a size of 150  $\mu\text{m}$  or below is homogeneously mixed by means of an ordinary mixer and a binder is gradually added to the ground precursor, followed by sufficient kneading. Then, the kneaded mixture was fed into an extruding granulator to obtain a granulate, followed by screening. If necessary, the granulate may be coated, prior to the screening, with a fine inorganic powder having an average primary particle size of 0.1  $\mu\text{m}$  or below, such as finely powdered silica, for the purpose of improving the granular characteristics.

The peroxide to be used in the present invention is preferably hydrogen peroxide or a peroxide which generates hydrogen peroxide in an aqueous solution.

Examples of the peroxide which generates hydrogen peroxide in an aqueous solution include sodium carbonate-hydrogen peroxide adduct, sodium tripolyphosphate-hydrogen peroxide adduct, sodium pyrophosphate-hydrogen peroxide adduct, urea-hydrogen peroxide adduct,  $4\text{Na}_2\text{SO}_4 \cdot 2\text{H}_2\text{O}_2 \cdot \text{NaCl}$ , sodium perborate monohydrate, sodium perborate tetrahydrate, sodium peroxide and calcium peroxide, among which sodium carbonate-hydrogen peroxide adduct, sodium perborate monohydrate and sodium perborate tetrahydrate are particularly preferred.

According to the present invention, a peroxide and a specified activator as defined above are generally used in a molar ratio of said peroxide to said activator of between 99.1 : 0.1 and 20 : 80, preferably between 99 : 1 and 50 : 50. It is preferable that the composition comprises 1 to 99 percent by weight of the component (a).

The bleaching detergent composition of the invention may comprises the following in addition to the above shown bleaching agents.

#### [1] Surfactants:

- (1) Straight-chain or branched alkylbenzenesulfonate salts having an alkyl group of 10-16 carbon atoms in average.
- (2) Alkyl or alkenyl ether sulfate salts having a straight-chain or branched alkyl or alkenyl group of 10-20 carbon atoms in average, 0.5-8 mol in average of ethylene oxide, propylene oxide or butylene oxide in the molecule and an addition ratio of ethylene oxide/propylene oxide of 0.1/9.9-9.9/0.1 or ethylene oxide/butylene oxide of 0.1/9.9-9.9/0.1.
- (3) Alkyl or alkenyl sulfate salts having an alkyl or alkenyl group of 10-20 carbon atoms in average.
- (4) Olefinsulfonate salts having 10-20 carbon atoms in average in the molecule.
- (5) Alkanesulfonate salts having 10-20 carbon atoms in average in the molecule.
- (6) Saturated or unsaturated fatty acid salts having 10-24 carbon atoms in average in the molecule.
- (7) Alkyl or alkenyl ether carboxylate salts having an alkyl or alkenyl group of 10-20 carbon atoms in average, 0.5-8 mol in average of ethylene oxide, propylene oxide or butylene oxide in the molecule and an addition ratio of ethylene oxide/propylene oxide of 0.1/9.9-9.9/0.1 or ethylene oxide/butylene oxide of 0.1/9.9 to 9.9/0.1.
- (8)  $\alpha$ -Sulfo fatty acid salts or esters of the general formula:

wherein Y represents an alkyl group having 1-3 carbon atoms or a counter-ion, Z represents a counter-ion and R represents an alkyl or alkenyl group having 10-20 carbon atoms.

As the counter-ions of anionic surfactants, there may be mentioned, for example, ions of alkali metals such as sodium and potassium, alkaline earth metals such as calcium and magnesium; ammonium, alkanolamines containing 1-3 alkanol groups having 2 or 3 carbon atoms such as monoethanolamine, diethanolamine, triethanolamine and triisopropanolamine.

(9) Amino acid-type surfactants of the general formulae:

wherein  $R_1$  represents an alkyl or alkenyl group having 8-24 carbon atoms,  $R_2$  represents hydrogen or an alkyl group having 1-2 carbon atoms,  $R_3$  represents an amino acid residue and X represents an alkali metal or alkaline earth metal ion.

wherein  $R_1$ ,  $R_2$  and X have the same meanings as above and  $n$  represents an integer of 1-5.

wherein  $R_1$  has the same meaning as above and  $m$  represents an integer of 1-8.

wherein  $R_1$ ,  $R_3$  and X have the same meaning as above and  $R_4$  represents hydrogen, or an alkyl or hydroxyalkyl group having 1-2 carbon atoms.

wherein  $R_2$ ,  $R_3$  and X have the same meaning as above and  $R_5$  represents a  $\beta$ -hydroxyalkyl or  $\beta$ -hydroxyalkenyl group having 6-28 carbon atoms.

wherein  $R_3$ ,  $R_5$  and X have the same meaning as above.

(10) Phosphate ester surfactants:

No. 1 Acid alkyl (or alkenyl) phosphates:

wherein R' represents an alkyl or alkenyl group having 8-24 carbon atoms,  $n' + m'$  represents 3 and  $n'$  represents a number of 1-2.

No. 2 Alkyl (or alkenyl) phosphates:

wherein R' has the same meaning as above,  $n'' + m''$  represents a number of 3 and  $n''$  represents a number of 1-3.

No. 3 Alkyl (or alkenyl) phosphate salts:

wherein R',  $n''$  and  $m''$  have the same meaning as above and M represents Na, K or Ca.

(11) Sulfonic acid-type amphoteric surfactants of the general formulae:

No. 1

wherein  $R_{11}$  represents an alkyl or alkenyl group having 8-24 carbon atoms,  $R_{12}$  represents an alkylene group having 1-4 carbon atoms,  $R_{13}$  represents an alkyl group having 1-5 carbon atoms,  $R_{14}$  represents an alkylene or hydroxyalkylene group having 1-4 carbon atoms.

No. 2

wherein  $R_{11}$  and  $R_{14}$  have the same meaning as above and  $R_{15}$  and  $R_{16}$  each represent an alkyl or alkenyl group having 8-24 or 1-5 carbon atoms.

wherein  $\text{R}_{11}$  and  $\text{R}_{14}$  have the same meaning as above and  $n1$  represents an integer of 1-20.

(12) Betaine-type, amphoteric surfactants of the general formulae:

wherein  $\text{R}_{21}$  represents an alkyl, alkenyl,  $\beta$ -hydroxyalkyl or  $\beta$ -hydroxyalkenyl group having 8-24 carbon atoms,  $\text{R}_{22}$  represents an alkyl group having 1-4 carbon atoms and  $\text{R}_{23}$  represents an alkylene or hydroxyalkylene group having 1-6 carbon atoms.

wherein  $\text{R}_{21}$  and  $\text{R}_{23}$  have the same meaning as above and  $n2$  represents an integer of 1-20.

wherein  $\text{R}_{21}$  and  $\text{R}_{23}$  have the same meaning as above and  $\text{R}_{24}$  represents a carboxyalkyl or hydroxyalkyl group having 2-5 carbon atoms.

(13) Polyoxyethylene alkyl or alkenyl ethers having an alkyl or alkenyl group of 10-20 carbon atoms in average and 1-30 mol of ethylene oxide added.

(14) Polyoxyethylene alkylphenyl ethers having an alkyl group of 6-12 carbon atoms in average and 1-25 mol of ethylene oxide added.

(15) Polyoxypropylene alkyl or alkenyl ethers having an alkyl or alkenyl group of 10-20 carbon atoms in average and 1-20 mol of propylene oxide added.

(16) Polyoxybutylene alkyl or alkenyl ethers having an alkyl or alkenyl group of 10-20 carbon atoms in average and 1-20 mol of butylene oxide added.

(17) Nonionic surfactants having an alkyl or alkenyl group of 10-20 carbon atoms in average and 1-30 mol in total of ethylene oxide and propylene oxide added or ethylene oxide and butylene oxide added (ratio of ethylene oxide to propylene oxide or butylene oxide being 0.1/9.9 to 9.9/0.1).

(18) Higher fatty acid alkanolamides or alkylene oxide adducts thereof of the general formula:

wherein R'<sub>11</sub> represents an alkyl or alkenyl group having 10-20 carbon atoms, R'<sub>12</sub> represents H or CH<sub>3</sub>, n<sub>3</sub> represents an integer of 1-3 and m<sub>3</sub> represents an integer of 0-3.

(19) Sucrose/fatty acid esters comprising fatty acids having 10-20 carbon atoms in average and sucrose.

(20) Fatty acid/glycerol monoesters comprising fatty acids having 10-20 carbon atoms in average and glycerol.

(21) Alkylamine oxides of the general formula:

wherein R'<sub>13</sub> represents an alkyl or alkenyl group having 10-20 carbon atoms and R'<sub>14</sub> and R'<sub>15</sub> each represent an alkyl group having 1-3 carbon atoms.

(22) Cationic surfactants of the general formulae:

No. 1

wherein at least one of R'<sub>1</sub>, R'<sub>2</sub>, R'<sub>3</sub> and R'<sub>4</sub> represents an alkyl or alkenyl group having 8-24 carbon atoms and the remainder represents an alkyl group having 1-5 carbon atoms and X' represents a halogen.

No. 2

wherein R'<sub>1</sub>, R'<sub>2</sub>, R'<sub>3</sub> and X' have the same meaning as above.

No. 3

5

wherein R<sub>1</sub>, R<sub>2</sub> and X' have the same meaning as above, R<sub>5</sub> represents an alkylene group having 2-3 carbon atoms and n<sub>4</sub> represents an integer of 1-20.

The composition probably contains at least one of the above surfactants in an amount of at least 10 wt. %.

As preferred surfactants, there may be mentioned above surfactants 1), 2), 3), 4), 5), 6), 11)-No. 2, 12)-No. 1, 13), 14), 15), 17) and 18).

15

[2] Divalent metal ion sequestering agents:

The composition may contain 0-50 wt. % of one or more builder components selected from the group consisting of alkali metal salts or alkanolamine salts of the following compounds:

- 1) Salts of phosphoric acids such as orthophosphoric acid, pyrophosphoric acid, tripolyphosphoric acid, metaphosphoric acid, hexametaphosphoric acid and phytic acid.
- 2) Salts of phosphonic acids such as ethane-1,1-diphosphonic acid, ethane-1,1,2-triphosphonic acid, ethane-1-hydroxy-1,1-diphosphonic acid and its derivatives, ethane-hydroxy-1,1,2-triphosphonic acid, ethane-1,2-dicarboxy-1,2-diphosphonic acid and methanediolhydroxyphosphonic acid.
- 3) Salts of phosphono carboxylic acids such as 2-phosphonobutane-1,2-dicarboxylic acids, 1-phosphonobutane-2,3,4-tricarboxylic acids and α-methylphosphonosuccinic acid.
- 4) Salts of amino acids such as aspartic acid, glutamic acid and glycine.
- 5) Salts of aminopolyacetic acids such as nitrilotriacetic acid, iminodiacetic acid, ethylenediaminetetraacetic acid, diethylenetriaminepentaacetic acid, glycol ether diaminetetraacetic acid, hydroxyethyliminodiacetic acid, triethylenetetraminehexaacetic acid and dienkollic acid.
- 6) High-molecular electrolytes such as polyacrylic acid, polyacetic acid, polyitaconic acid, polycitraconic acid, polyfumaric acid, polymaleic acid, polymesaconic acid, poly-α-hydroxyacrylic acid, polyvinylphosphonic acid, sulfonated polymaleic acid, maleic anhydride/diisobutylene copolymer, maleic anhydride/styrene copolymer, maleic anhydride/methyl vinyl ether copolymer, maleic anhydride/ethylene copolymer, maleic anhydride/ethylene cross-linked copolymer, maleic anhydride/vinyl acetate copolymer, maleic anhydride/acrylonitrile copolymer, maleic anhydride/acrylate ester copolymer, maleic anhydride/butadiene copolymer, maleic anhydride/isoprene copolymer, poly-β-keto carboxylic acid derived from maleic anhydride and carbon monoxide, itaconic acid/ethylene copolymer, itaconic acid/itaconic acid copolymer, itaconic acid/maleic acid copolymer, itaconic acid/acrylic acid copolymer, malonic acid/methylene copolymer, mesaconic acid/fumaric acid copolymer, ethylene glycol/ethylene terephthalate copolymer, vinylpyrrolidone/vinyl acetate copolymer, 1-butene-2,3,4-tricarboxylic acid/itaconic acid/acrylic acid copolymer, quaternary ammonium group-containing polyester polyaldehyde carboxylic acids, cis-isomer of epoxysuccinic acid, poly[N,N-bis(carboxymethyl)acrylamide], poly(hydroxy carboxylic acid), starch succinate, starch maleate, starch terephthalate, starch phosphate ester, dicarboxystarch, dicarboxymethylstarch and cellulose succinate esters.
- 7) Non-dissociating high-molecular compounds such as polyethylene glycol, polyvinyl alcohol, polyvinylpyrrolidone and cold water-soluble, urethanated polyvinyl alcohol.
- 8) Salts of dicarboxylic acids such as oxalic acid, malonic acid, succinic acid, glutaric acid, adipic acid, pimelic acid, suberic acid, azelaic acid and decane-1,10-dicarboxylic acid; salts of diglycolic acid, thiodiglycolic acid, oxalacetic acid, hydroxydisuccinic acid, carboxymethylhydroxysuccinic acid and carboxymethyltartronic acid; salts of hydroxy carboxylic acids such as glycolic acid, malic acid, hydroxypivalic acid, tartaric acid, citric acid, lactic acid, gluconic acid, mucic acid, glucuronic acid and dialdehydestarch oxide; salts of itaconic acid, methylsuccinic acid, 3-methylglutaric acid, 2,2-dimethylmalonic acid, maleic acid, fumaric acid, glutamic acid, 1,2,3-propanetricarboxylic acid, aconitic acid, 3-butene-1,2,3-tricarboxylic acid, butane-1,2,3,4-tetracarboxylic acid, ethanetetracarboxylic acid, ethenetetracarboxylic acid, n-alkenylaconitic acid, 1,2,3,4-cyclopentanetetracarboxylic acid, phthalic acid, trimesic acid, hemimellitic acid, pyromellitic acid, benzenehexacarboxylic acid, tetrahydrofuran-1,2,3,4-tetracarboxylic acid and tetrahydrofuran-2,2,5,5-tetracarboxylic acid; salts of sulfonated carboxylic acids

55

such as sulfoitaconic acid, sulfotricarballylic acid, cysteic acid, sulfoacetic acid and sulfosuccinic acid; carboxymethylated sucrose, lactose and raffinose, carboxymethylated pentaerythritol, carboxymethylated gluconic acid, condensates of polyhydric alcohols or saccharides with maleic anhydride or succinic anhydride, condensates of hydroxy carboxylic acids with maleic anhydride or succinic anhydride, and organic acid salts such as CMOS and Builder M.

9) Aluminosilicates:

No. 1 Crystalline aluminosilicates of the formula:

wherein  $M'$  represents an alkali metal atom,  $M''$  represents an alkaline earth metal atom exchangeable with calcium, and  $x$ ,  $y$  and  $w$  represent mole numbers of the respective components and generally, they are as follows:  $0.7 \leq x \leq 1.5$ ,  $0.8 \leq y \leq 6$  and  $w$  being a positive number.

No. 2 Detergent builders having the following general formula are particularly preferred:

wherein  $n$  represents a number of 1.8-3.0 and  $w$  represents a number of 1-6.

No. 3 Amorphous aluminosilicates of the formula:

wherein  $M$  represents sodium and/or potassium atom, and  $x$ ,  $y$  and  $w$  represent mole numbers of the respective components within the following ranges:

$$0.7 \leq x \leq 1.2$$

$$1.6 \leq y \leq 2.8$$

$w$ : any positive number including 0.

No. 4 Amorphous aluminosilicates of the formula:

wherein  $M$  represents Na or K and  $X$ ,  $Y$ ,  $Z$  and  $\omega$  represent mole numbers of the respective components within the following ranges:

$$0.20 \leq X \leq 1.10$$

$$0.20 \leq Y \leq 4.00$$

$$0.001 \leq Z \leq 0.80$$

$\omega$ : any positive number including 0.

[3] Alkalis or inorganic electrolytes:

The composition may contain also 1-50 wt. %, preferably 5-30 wt. %, of one or more alkali metal salts selected from the following compounds as the alkali or inorganic electrolyte: silicates, carbonates and sulfates. Further, the composition may contain organic alkalis such as triethanolamine, diethanolamine, monoethanolamine and triisopropanolamine.

[4] Antiredeposition agents:

The composition may contain 0.1-5 % of one or more of the following compounds as antiredeposition agent(s): polyethylene glycol, polyvinyl alcohol, polyvinylpyrrolidone and carboxymethylcellulose.

[5] Enzymes (enzymes which exhibits the essential enzymatic effects thereof in the deterging step):

As the enzymes, the following enzymes may be mentioned (classified with respect to their enzymatic reactivities):

Hydrolases, hydrases, oxido-reductases, desmolases, transferases and isomerases. All of these enzymes may be used in the present invention. Particularly preferred enzymes are hydrolases such as proteases, esterases, carbohydrases and nucleases.

Examples of proteases are pepsin, trypsin, chymotrypsin, collagenase, keratinase, elastase, subtilisin, BPN, papain, bromelin, carboxypeptidases A and B, aminopeptidase and aspergillopeptidases A and B.

Examples of esterases are gastric lipase, pancreatic lipase, vegetable lipases, phospholipases, cholinesterases and phosphotases.

Carbohydrolases include alkali cellulases, maltase, saccharase, amylase, pectinase, lysozyme,  $\alpha$ -glucosidase and  $\beta$ -glucosidase.

#### [6] Bluing agents and fluorescent dyes:

Various bluing agents and fluorescent dyes may be incorporated in the composition, if necessary. For example, compounds of the following structures are recommended:

The following caking-preventing agents may be incorporated in powdery detergent composition: p-toluenesulfonate salts, xylenesulfonate salts, acetate salts, sulfosuccinate salts, talc, finely pulverized silica, clay, calcium silicates (such as Micro-Cell of Johns-Manville Co.), calcium carbonate and magnesium oxide.

The antioxidants include, for example, tert-butylhydroxytoluene, 4,4'-butylidenebis(6-tert-butyl-3-methylphenol), 2,2'-butylidenebis(6-tert-butyl-4-methylphenol), monostyrenated cresol, distyrenated cresol, monostyrenated phenol, distyrenated phenol and 1,1'-bis(4-hydroxyphenyl)cyclohexane.

A stabilizer may be used in the bleaching detergent composition, including a magnesium salt such as magnesium sulfate, magnesium silicate, magnesium chloride, magnesium silicofluoride, magnesium oxide and magnesium hydroxide and a silicate such as sodium silicate.

( Example )

16

III-a and III-b falling within (b-5), (IV-a) and (IV-b) falling within (b-6) and (IV-c) falling within the definition of the polyalkylenepolyamine compound, and two comparative organic peracid precursors, II-a and II-b were produced.

#### 5 Production Example 1

##### Synthesis of

Chloroacetonitrile was dissolved in 20 cc of acetone in a 100-ml three-necked flask. Dry trimethylamine was bubbled into the solution by using nitrogen as a carrier gas, while stirring the solution with a magnet stirrer. After the bubbling had been continued over a period of 3 hours to thereby introduce twice by equivalent as much trimethylamine as chloroacetonitrile, the flask was sealed and stirred at a room temperature overnight. The generated white crystal was separated by filtration to give 8.93 g of the compound (I-a). Yield: 95.3%

#### 25 Production Example 2

##### Synthesis of

10.7 g of dimethyloctylamine was dissolved in 20 ml of ethanol in a 100-ml two-necked flask fitted with a cooling tube, followed by the dropwise addition of 5.42 g of chloroacetonitrile. After the completion of the dropwise addition, the mixture was heated on an oil bath (temperature: 90°C) to carry out the reaction under the reflux of the ethanol, until the disappearance of the starting amine was confirmed by TLC. The resulting reaction mixture was distilled to remove the ethanol to obtain 15.76 g of a quaternary salt of the above formula. Yield: 99.3%

#### 45 Production Example 3 (Comparative Example)

##### Synthesis of

6.0 g of 2-dimethylaminoethyl acetate was dissolved in 20 ml of acetone in a 100-ml two-necked flask. 8.6 g of chloroacetonitrile was dropwise added to the flask at a room temperature. The obtained mixture was stirred at that temperature for 8 hours and distilled to remove the solvent. The residue was sufficiently

# EP 0 303 520 B1

washed with acetone and distilled to remove the acetone. Thus, 7.3 g of the cationic compound was obtained as a colorless oil. Yield: 93%

## Physical properties

## Production Example 4 (Comparative Example)

### Synthesis of

5 g of 2-dimethylaminoethyl benzoate was dissolved in 20 ml of acetone in a 100-ml two-necked flask. 5.9 g of chloroacetonitrile was dropwise added to the flask at a room temperature. The obtained mixture was stirred at that temperature for 8 hours and filtered to give white crystals. The crystals were washed with acetone and dried to give 6.17 g of the cationic compound as a colorless crystal. Yield: 89%

## Physical properties

## Production Example 5

The compound (III-a) was synthesized.

Ten grams of pyridine was dissolved in 20 cc of acetone. Then 14.3 g of chloroacetonitrile was added dropwise to the solution, while stirred. The mixture continued to be stirred for 8 hours at room temperature. The reaction product mixture was found to be lightly brown and 18.0 grams of the compound (III-a) was isolated from it with a production yield of 92.3 percent.

Melting point:

201 to 203 °C (dec.).

#### Production Example 9

#### 10 Synthesis of (IV-c)

100 g of an amine represented by the formula:

20

was dissolved in 400 cc of ethanol in a 1000-ml three-necked flask fitted with a cooling tube to give a solution. 131.3 g of chloroacetonitrile was dropwise added to the solution. After the completion of the dropwise addition, the temperature of the obtained mixture was raised with an oil bath (temperature: 90 °C). The resulting mixture was heated under reflux of the ethanol for 24 hours and distilled to remove the ethanol. Thus, 177.3 g of a quaternary ammonium salt of the above amine was obtained. Conversion into quaternary ammonium salts: 76.6%

25

#### Examples 1 to 8 of Composition

30

Bleaching compositions were prepared, shown in Table 1, using the organic peracid precursors I-a to IV-c, with control compositions 1 to 4, and tested on their bleaching effect in terms of a bleaching rate or a bleaching extent. Results are shown in Table 1.

(Dip bleaching effect (Table 1))

35

Sodium percarbonate was dissolved in 300 ml of water of 20 °C to prepare a solution having an active oxygen content of 0.05%. An activator was added to the solution in such a way that one sixteenth of the equivalent amount of the hydrogen peroxide contained in the solution was equal to the equivalent amount of the C=N group of the activator. Thus, a bleach composition was obtained. Five black tea-stained cloths (8 x 8 cm<sup>2</sup>) which had been prepared by the method which will be described below were soaked in the bleach composition for 30 minutes, washed with water and dried. The rate of bleaching was calculated by the following equation: rate of bleaching with respect to black tea-stained cloth:

40

45

$$\begin{array}{l} \text{bleaching} \\ \text{extent} \\ (\%) \end{array} = \frac{\text{reflectance after bleaching} - \text{reflectance before bleaching}}{\text{reflectance of white cloth} - \text{reflectance before bleaching}} \times 100$$

50

These reflectances were determined with NDR-101DP mfd. by Nippon Denshoku Kogyo K.K. by the use of a filter of 460 nm. Black tea-stained cloth:

55

80 g of NITTOH black tea (yellow package) was boiled in 3 l of ion-exchanged water for about 15 minutes and the resulting mixture was filtered through a desized bleached cotton cloth. A cotton shirting cloth #2003 was immersed in the obtained filtrate and boiled for about 15 minutes. The cloth immersed in the filtrate was taken off as such from fire and allowed to stand for about 2 hours. The resulting cloth was spontaneously dried and washed with water until the washings became colorless. The resulting cloth was

dehydrated and pressed to form a test piece (8 x 8 cm).

In Table 1, the compound shown (1) has the formula:

TAED shown (2) is tetraacetythylenediamine being available from Hoechst. The compound shown (3) is available Interlox. The bleaching extent shown (4) is measured with a solution having an active oxygen concentration of 0.05%.

#### Examples 9 and 10 of Composition

Bleaching method:

Hydrogen peroxide was added to 300 ml of water at 20 °C so that the effective oxygen concentration was 0.05%, and 1 g of sodium carbonate was further added thereto. The compound (IV-a) or (IV-b) was added to the solution in an amount equimolar to hydrogen peroxide. A black tea stained cloth prepared in the same was as before, having a size of 10 cm and 10 cm, was immersed in the solution for 30 minutes to effect bleaching. The cloth was washed with water and dried, and the bleaching ratio was calculated according to the formula described below. Sodium hypochlorite as a comparative product was evaluated at an effective chlorine concentration of 0.06%. Results are shown in Table 2.

#### Examples 11 to 18 of Detergent Composition

Sodium percarbonate and cationic compounds shown in Table 3 were added to a solution of a heavyduty detergent comprising a nonionic surfactant as a base, not containing an anionic one, being available in the commercial market, to prepare a detergent solution having a composition given in Table 3. Five black tea-stained cloths (8x8 cm<sup>2</sup>) prepared by the above-mentioned procedure were washed with the detergent solution in a Terg-O-Tometer at 20 °C for 10 minutes, washed with water dried and examined for the rate of bleaching according to the above mentioned method. Results are shown in Table 3, together with data of control compositions 7 to 10.

#### Example 19

The three bleaching compositions, containing no phosphorus, a small amount of phosphorus and a considerable amount of phosphorus, respectively, were obtained in the below shown formulations. Percent is based on weight.

The composition containing no phosphorus was obtained from 14% of sodium linear dodecylbenzene sulfonate, 6% of polyoxyethylene(10 moles of EO) C12 to C13 alkyl ether, 2% of sodium salt of hardened beef tallow aliphatic acid, 5% of sodium silicate of 2 go, 10% of sodium carbonate, 25% of zeolite of the 4A type, 10% of sodium percarbonate, 10% of the cationic compound (IV-a), 2% of polyethylene glycol having a molecular weight of 6,000, 2% of protease, 4% of water and the balance of sodium sulfate.

The compound having a small amount of phosphorus was obtained from 10% of sodium linear dodecylbenzene sulfonate, 2% of sodium dodecylsulfate, 8% of polyoxyethylene(7.7 moles of EO) C12 to C13 alkyl ether, 2% of sodium salt of hardened beef tallow aliphatic acid, 5% of sodium silicate of 1 go, 10% of sodium carbonate, 20% of zeolite of the 4A type, 15% of sodium pyrophosphate, 10% of sodium perborate, 5% of the cationic compound (IV-a), 1% of polyethylene glycol having a molecular weight of 11,000, 1% of sodium sulfite, 2% of protease, 4% of water and the balance of sodium sulfate.

The compound containing a considerable amount of phosphorus was obtained from 20% of polyoxyethylene(8.8 moles of EO) beef tallow alcohol ether, 2% of sodium salt of hardened beef tallow aliphatic acid, 30% of sodium tripolyphosphate, 10% of sodium perborate, 5% of the cationic compound (IV-a), 5% of sodium silicate of 2 go, 10% of sodium carbonate, 1% of sodium sulfite, 2% of polyethylene glycol having a molecular weight of 6,000, 2% of protease, 6% of water and the balance of sodium sulfate.

## Claims

1. A bleaching composition which comprises (a) a peroxide and (b) an organic peracid precursor of at least one of the following formulae:

in which R1 is an unsubstituted C1 to C24 alkenyl, an unsubstituted alkaryl having a C1 to C24 alkyl, R2 and R3 are each independently a C1 to C3 alkyl, hydroxyalkyl having 1 to 3 carbon atoms, - (C2H4O)<sub>n</sub> H, n being 1 to 6, -CH<sub>2</sub>-CN and X is an anion;

in which each of R1 to R5 is independently hydrogen, a C1 to C10 alkyl, a C1 to C10 alkenyl, a substituted C1 to C10 alkyl, a substituted C1 to C10 alkenyl, carboxyl, sulfonyl or cyano, X is an anion;

in which R1, R2, R3 and R4 are each independently a C1 to C6 alkyl, n is an integer from 1 to 16 and X is an anion; or an alkylene diamine or a polyalkylenepolyamine compound having at least one quaternary ammonium group with either one or two -CH<sub>2</sub>CN groups directly bound to the quaternary nitrogen

2. A bleaching composition as claimed in claim 1, which further comprises at least one detergent component.
3. A bleaching composition as claimed in claim 1 or 2, wherein the mole ratio of (a) to (b) is from 99.9/0.1 to 20/80.
4. A bleaching composition as claimed in any one of claims 1 to 3 which comprises granules of a blend of 100 parts by weight of (b) and 5 to 20 parts by weight of a binder.
5. A cationic compound having the generic formula (b-6) defined in claim 1.
6. A compound as claimed in claim 5, in which the formula R1, R2, R3 and R4 are independently alkyl groups having 1 to 3 carbon atoms and n is an integer from 1 to 9.
7. A compound as claimed in claim 6, in which the formula R1, R2, R3 and R4 are methyl.

Patentansprüche

1. Bleichzusammensetzung, umfassend (a) ein Peroxid und (b) einen organischen Persäurevorläufer, dargestellt durch wenigstens eine der folgenden Formeln:

worin bedeuten:

R<sub>1</sub> ein nichtsubstituiertes C<sub>1</sub> bis C<sub>24</sub> Alkenyl, ein nichtsubstituiertes Alkaryl mit C<sub>1</sub> bis C<sub>24</sub> Alkyl, R<sub>2</sub> und R<sub>3</sub> unabhängig ein C<sub>1</sub> bis C<sub>3</sub> Alkylhydroxyalkyl mit 1 bis 3 Kohlenstoffatomen, - (C<sub>2</sub>H<sub>4</sub>O)<sub>n</sub> H, n 1 bis 6, -CH<sub>2</sub>-CN und X ein Anion;

worin R<sub>1</sub> bis R<sub>5</sub> unabhängig Wasserstoff, ein C<sub>1</sub> bis C<sub>10</sub> Alkyl, ein C<sub>1</sub> bis C<sub>10</sub> Alkenyl, ein substituiertes C<sub>1</sub> bis C<sub>10</sub> Alkyl, ein substituiertes C<sub>1</sub> bis C<sub>10</sub> Alkenyl, Carboxyl, Sulfonyl oder Cyano und X ein Anion bedeuten;

worin R<sub>1</sub>, R<sub>2</sub>, R<sub>3</sub> und R<sub>4</sub> unabhängig ein C<sub>1</sub> bis C<sub>6</sub> Alkyl, n eine ganze Zahl von 1 bis 16 und

X ein Anion bedeuten; oder

ein Alkylendiamin oder eine Polyalkylenpolyaminverbindung mit wenigstens einer quaternären Ammoniumgruppe mit entweder ein oder zwei -CH<sub>2</sub>CN Gruppen, direkt an das quaternäre Stickstoff gebunden.

2. Bleichzusammensetzung nach Anspruch 1, welche weiterhin wenigstens eine Reinigungskomponente umfaßt.
3. Bleichzusammensetzung nach Anspruch 1 oder 2, worin das Molverhältnis von (a) zu (b) 99,9/0,1 bis 20/80 beträgt.
4. Bleichzusammensetzung nach einem der Ansprüche 1 bis 3, umfassend Körnchen einer Mischung aus 100 Gew.-Teilen von (b) und fünf bis 20 Gew.-Teilen eines Bindemittels.
5. Kationische Verbindung der allgemeinen Formel (b-6) gemäß Anspruch 1.

6. Verbindung nach Anspruch 5, worin in der Formel  $R_1$ ,  $R_2$ ,  $R_3$  und  $R_4$  unabhängig für Alkylgruppen mit 1 bis 3 Kohlenstoffatomen stehen und  $n$  eine ganze Zahl von 1 bis 9 bedeutet.

7. Verbindung nach Anspruch 6, worin in der Formel  $R_1$ ,  $R_2$ ,  $R_3$  und  $R_4$  Methyl sind.

# Revendications

1. Composition de blanchiment, qui comprend (a) un peroxyde et (b) un précurseur de peracide organique répondant au moins à l'une des formules suivantes

10

15

dans laquelle  $R_1$  est un groupe alcényle en  $C_1$  à  $C_{24}$  non substitué, un groupe alkylaryle non substitué comportant un groupe alkyle en  $C_1$  à  $C_{24}$ ,  $R_2$  et  $R_3$  sont chacun indépendamment un groupe alkyle en  $C_1$  à  $C_3$ , hydroxyalkyle comportant 1 à 3 atomes de carbone,  $-(C_2H_4O)_nH$ ,  $n$  étant de 1 à 6,  $-CH_2-CN$ , et  $X$  est un anion ;

20

25

30

dans laquelle chacun des radicaux  $R_1$  à  $R_5$  est indépendamment un atome d'hydrogène, un groupe alkyle en  $C_1$ - $C_{10}$ , alcényle en  $C_1$ - $C_{10}$ , alkyle en  $C_1$ - $C_{10}$  substitué, alcényle en  $C_1$ - $C_{10}$  substitué, carboxyle, sulfonyle ou cyano,  $X$  est un anion ;

35

40

dans laquelle  $R_1$ ,  $R_2$ ,  $R_3$  et  $R_4$  sont chacun indépendamment un groupe alkyle en  $C_1$  à  $C_6$ ,  $n$  est un nombre entier de 1 à 16 et  $X$  est un anion ; ou un composé alkylène-diamine ou polyalkylène-polyamine possédant au moins un groupe ammonium quaternaire avec un ou deux groupes  $-CH_2CN$  directement liés à l'atome d'azote quaternaire.

45

2. Composition de blanchiment selon la revendication 1, qui comprend aussi au moins un constituant détergent.

50

3. Composition de blanchiment selon la revendication 1 ou 2, dans laquelle le rapport molaire de (a) à (b) est de 99,9/0,1 à 20/80.

55

4. Composition de blanchiment selon l'une quelconque des revendications 1 à 3, qui comprend des granulés d'un mélange de 100 parties en poids de (b) et de 5 à 20 parties en poids d'un liant.

5. Composé cationique de formule générique (b-6) définie dans la revendication 1.

**EP 0 303 520 B1**

6. Composé selon la revendication 5, dans lequel, dans la formule,  $R_1$ ,  $R_2$ ,  $R_3$  et  $R_4$  sont chacun indépendamment des groupes alkyle possédant 1 à 3 atomes de carbone et  $n$  est un nombre entier de 1 à 9.
- 5 7. Composé selon la revendication 6, dans lequel, dans la formule,  $R_1$ ,  $R_2$ ,  $R_3$  et  $R_4$  sont chacun des groupes méthyle.
